RF exposure letter

RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] \bullet [\lor f(GHz)] \le 3.0 for 1-g SAR and \le 7.5 for 10-g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

Worse case is as below: [2402 MHz -1.943dBm (0.639 mW) output power]

 $(0.639 \text{mW /5mm}) \cdot [\sqrt{2.402(\text{GHz})}] = 0.198 < 3.0 \text{ for } 1-\text{g SAR}$

Then SAR evaluation is not required
